

COMBINING TEXT EMBEDDING AND KNOWLEDGE GRAPH EMBEDDING TECHNIQUES FOR ACADEMIC SEARCH ENGINES

SEMDEEP-4, OCT. 2018

STKO Lab, University of California, Santa Barbara

INTRODUCTION

- The past decades have witnessed a rapid increase in the global scientific output as measured by publish papers.
- Exploring a scientific field and searching for relevant papers and authors seems like a needle-in-a-haystack problem.

INTRODUCTION

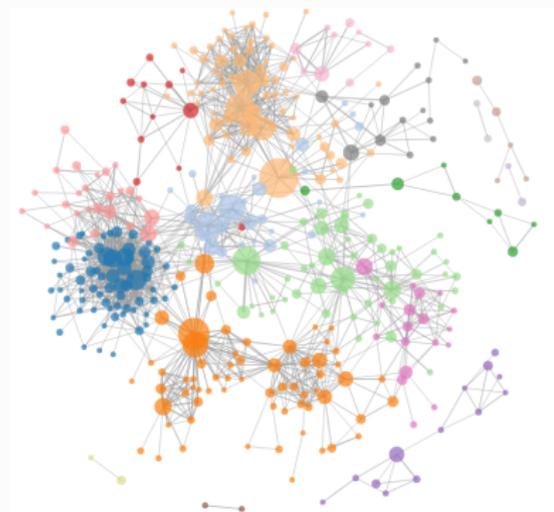

- Several academic search engines have been established to facilitate this process such as Google Scholar, Microsoft Academic Search, Semantic Scholar, DBLP, and so forth.

- They provide paper-level (and sometimes author-level) recommendations based on: textual content, authors, publication year, and citation information.

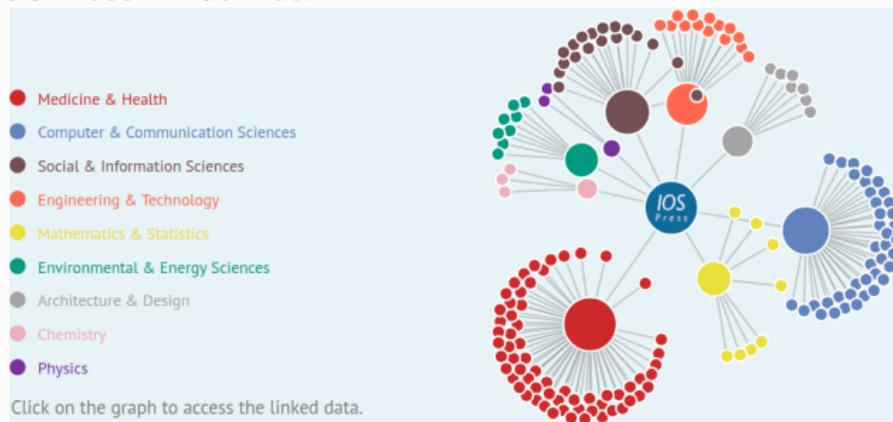

INTRODUCTION

- Score question: how to define and measure *similarity* and *relatedness* among research papers, authors, potential funding sources, and so forth.
- Conventional way: using feature engineering which extracts features from textual content, citation networks, and co-author networks

INTRODUCTION

- Semantic Web technologies play an increasing role in the field of academic publishing for easing publishing, retrieving, interlinking, and integrating datasets across outlets and publishers.
 - Springer Nature SciGraph
 - DBLP SPAQRL endpoint
 - IOS Press LD Connect

- The availability of these bibliography knowledge graphs makes it possible to bring entity retrieval and content-based paper recommendations together.

OUR CONTRIBUTION

- We present an entity retrieval prototype on top of IOS LD Connect which utilizes both textual information and structure information.
 - An entity retrieval system based on paragraph vectors and knowledge graph embeddings.
 - A paper similarity benchmark dataset from Semantic Scholar which is used to empirically evaluate the learned embedding models.
 - Another benchmark dataset from DBLP is constructed and used to evaluate the performance of the learned knowledge graph embedding model.

IOS PRESS LD CONNECT

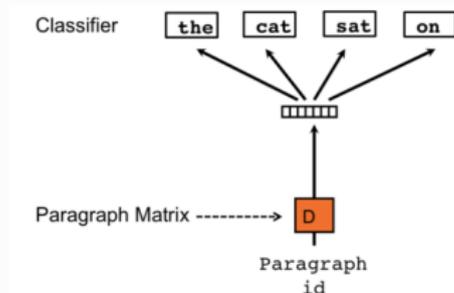

- This knowledge graph encodes the information about all the papers published by IOS Press until now.
- All metadata about papers are serialized and published as Linked Data by following the bibliographic ontology.
- a SPARQL endpoint:
<http://ld.iospress.nl:3030>
- a dereference interface:
<http://ld.iospress.nl/ios/ios-press>.

TABLE: An overview of LD Connect as of 05/2018

| Class Name | # of Instances |
|----------------------|----------------|
| prov:Publisher | 1 |
| bibo:Journal | 125 |
| bibo:Series | 41 |
| bibo:Periodical | 2255 |
| bibo:Issue | 8891 |
| bibo:Chapter | 46915 |
| bibo:AcademicArticle | 80891 |
| foaf:Person | 385272 |
| foaf:Organization | 168360 |
| rdf:Seq | 109309 |

TEXTUAL EMBEDDING

- Distributed Bag of Words version of Paragraph Vector (PV-DBOW), is used to encode all textual information of each paper into low dimensional vectors.
- PV-DBOW aims to maximize the average log probability of predicting a word given the paper.
- The learned vectors preserve the semantics of the text.

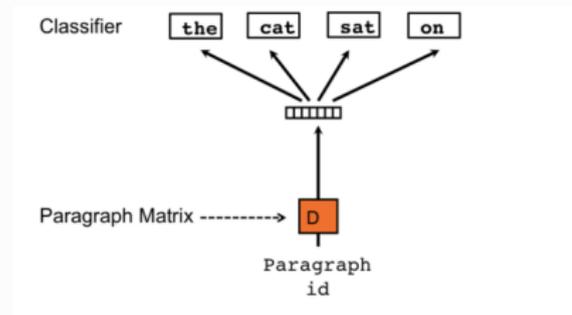

TEXTUAL EMBEDDING

- PV-DBOW calculates average log probability for a sequence of training words w_1, w_2, \dots, w_T in paper pg_i .

$$\frac{1}{T} \sum_{t=1}^T \log p(w_t | pg_i) \quad (1)$$

- The prediction is done by means of a softmax classifier shown in Equation 2.

$$p(w_t | pg_i) = \frac{\exp(y_{w_t})}{\sum_j \exp(y_j)} \quad (2)$$

TEXTUAL EMBEDDING

- PV-DBOW assumed that cosine similarity between two paragraph vectors represents the semantic similarity between the corresponding texts.
- all 117,835 PDF documents are parsed and mapped to entities in the knowledge graph.
- After some text preprocessing steps such as tokenization and lemmatization, the preprocessed texts of each paper are fed into PV-DBOW model.

STRUCTURE EMBEDDING

- An **entity retrieval system** for a bibliographic dataset should go beyond simple similar paper search.
 - finding similar researchers
 - searching similar organizations
 - reviewer recommendations
- **Challenge:** The symbolic representations of KGs prohibit the usage of probabilistic models which are widely used in many kinds of ML applications.
- **Core problem:** how to *transform* the components of these heterogeneous networks into numerical representations such that they can be easily utilized in an entity retrieval system.

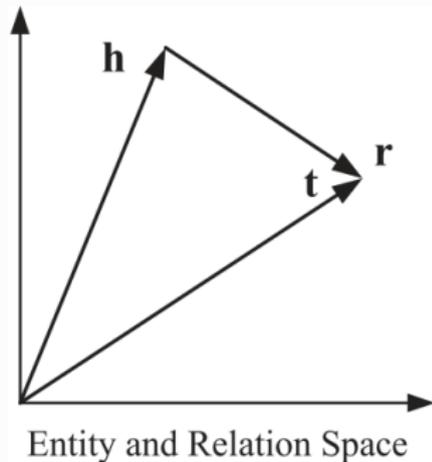

STRUCTURE EMBEDDING

- **KG Embedding:** learning distributional representations for components of a KG while preserving the inherent structure of the original KG.
 - *Translation-based models* (e.g. **TransE**, TransH, and TransR)
 - *Semantic matching models* (e.g. RESCAL, HoIE, and DisMult).

STRUCTURE EMBEDDING

- Given a knowledge graph G which contains a collection of triples/statements (h_i, r_i, t_i)
- TransE embeds the entities and relations in a KG into the same low-dimensional space
- TransE treats each relation r_i as a transformation operation from the head entity h_i to the tail entity t_i .
- A plausibility scoring function $d(h_i, r_i, t_i)$ is defined on each triple which measures the accuracy of the translation operation:

$$d(h_i, r_i, t_i) = \| \mathbf{h}_i + \mathbf{r}_i - \mathbf{t}_i \| \quad (3)$$

(a) TransE.

STRUCTURE EMBEDDING

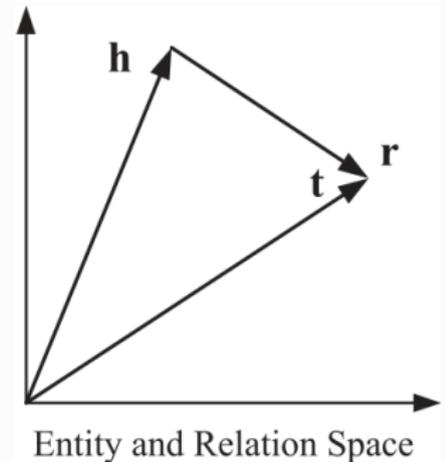

- A margin-based loss function \mathcal{L} is defined to set up an optimization problem

$$\mathcal{L} = \sum_{(h_i, r_i, t_i) \in G^+} \sum_{(h'_i, r'_i, t'_i) \in G^-_{(h_i, r_i, t_i)}} [\gamma + d(h_i, r_i, t_i) - d(h'_i, r'_i, t'_i)]_+ \quad (4)$$

- TransE has been applied to the entire LD Connect graph to learn the embeddings for all entities and relations.

STRUCTURE EMBEDDING

- We choose **TransE**:
 - Efficient to run on a large knowledge graph;
 - A very intuitive geometric interpretation;
 - TransE embeds all entities and relations in the same low-dimensional vector space which is important for property path reasoning.

(a) TransE.

PAPER SIMILARITY SEARCH INTERFACE

- A similar paper search interface¹ based on the learned PV-DBOW model.

ENTITY SIMILARITY SEARCH INTERFACE

- An entity similarity search interface² is developed based on the TransE model for searching different types of entities like papers, authors, journals, and organizations.

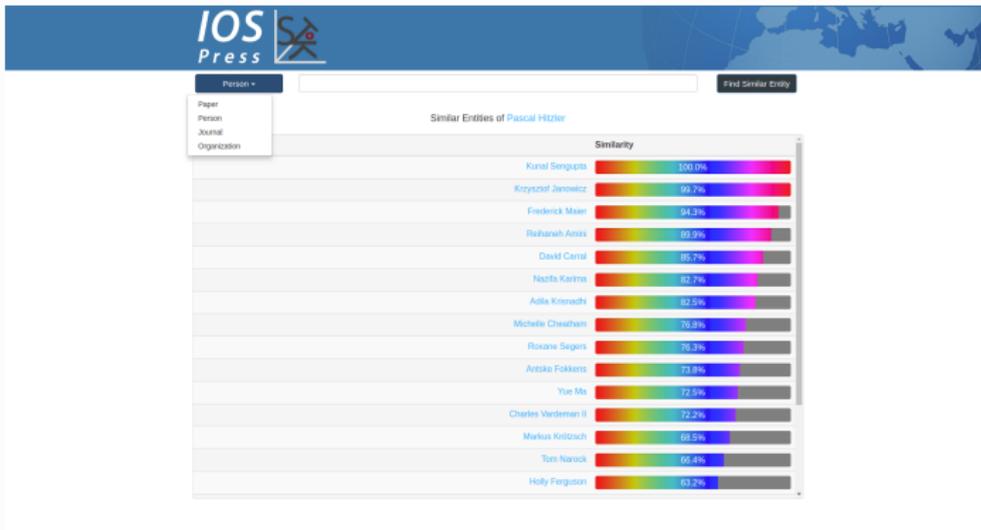

FIGURE: Entity similarity search interface

²<http://stko-testing.geog.ucsb.edu:3000/ios/qe/entity>

PAPER SIMILARITY EVALUATION

- **Similar paper binary classification task:** Given a paper q_i as the query paper and K papers d_k where $k \in 1, 2, \dots, K$ within the IOS Press corpus, we classify each pair (q_i, d_k) for $k \in 1, 2, \dots, K$ as *similar* or *dissimilar*.
- **Features:** Combine textual and structure embeddings for a similar paper search task.

PAPER SIMILARITY EVALUATION

- Establish a paper similarity benchmark dataset:
 - Use the title of all paper (106705) in the IOS Press corpus to search for the top 500 similar papers in Semantic Scholar;
 - Co-reference papers in the search results to the papers in IOS Press document corpus by the DOIs and the titles and treat them as positive samples;
 - The same number of papers are randomly selected from the rest of the corpus and labeled as negative samples.

PAPER SIMILARITY EVALUATION

- 33871 paper search results left and on average 4.96 relevant papers for each search paper.
- Given a query paper q_i and a list of papers d_k ($k \in 1, 2, \dots, 2K$) where d_1, d_2, \dots, d_K are positive samples and $d_{K+1}, d_{K+2}, \dots, d_{2K}$ are negative samples:
 - Cosine similarity PV_{ik} between the textual embeddings of q_i and d_k
 - Cosine similarity KG_{ik} between the structure embeddings of q_i and d_k
 - Train a logistic regression model based on PV_{ik} and KG_{ik} and compare with the baseline models which use only one feature PV_{ik} or KG_{ik} in the logistic regression

TABLE: The evaluation results of paper similarity binary classification task

| | Precision | Recall | F1 |
|----------------|-----------|--------|--------|
| Combined Model | 0.8790 | 0.8372 | 0.8576 |
| PV-DBOW | 0.8770 | 0.8345 | 0.8552 |
| TransE | 0.6747 | 0.6817 | 0.6782 |

CO-AUTHOR INFERENCE EVALUATION

- Is TransE model seem useless?
- Node *A*, *B*, *C*, and *D* refer to four authors in LD Connect and DBLP.
- The links between nodes represent the co-author relationship.
- **Hypothesis:** a similarity search on the trained TransE model for author *A* will likely also yield author *D* even though their co-author relationship is missing in IOS Press LD Connect

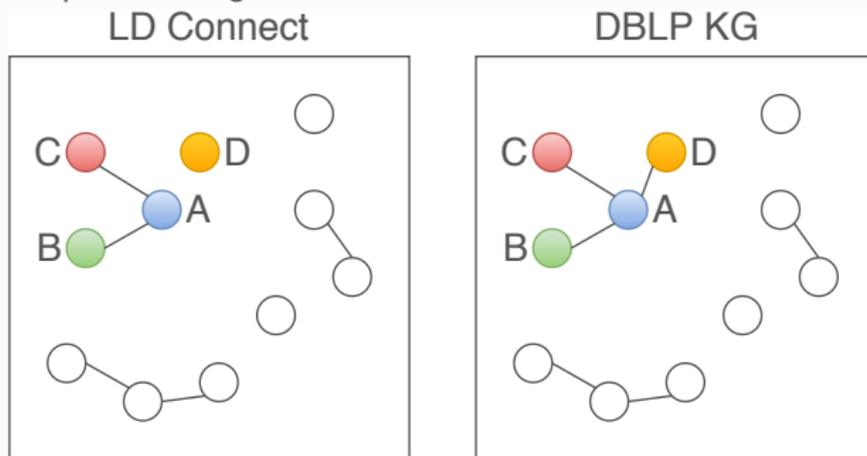

FIGURE: An illustration of co-author inference evaluation

CO-AUTHOR INFERENCE EVALUATION

Build a co-author dataset from DBLP:

- Randomly select 10,000 authors from LD Connect corpus;
- Based on the TransE embeddings, for each selected author p_i , obtain the top 10 similar authors p_{ik} where $k \in 1, 2, \dots, 10$ who have not co-authored any paper with p_i according to LD Connect;
- For each pair of authors (p_i, p_{ik}) , search for # of co-authored papers they have in DBLP KG which forms author pair dataset C ;
- For each selected author p_i , *randomly* select 10 authors p'_{ik} where $k \in 1, 2, \dots, 10$ from the conflated LD Connect;
- For each pair of authors (p_i, p'_{ik}) , search for # of their co-authored papers in DBLP KG which forms author pair dataset C' ;
- Compute the ratio of co-author relationship for these person pairs in C and C' and compare them.

CO-AUTHOR INFERENCE EVALUATION

Result:

- 5.511 percent of author pairs in C which have co-author relationships in DBLP KG.
- Only 1.537 percent for the randomly selected author pair dataset C' .
- This validates our assumption that the TransE model can help predict the missing co-author relationship between authors based on the observed graph structure.

CONCLUSION

- We presented an entity retrieval system utilizing LD Connect based on textual embedding and structure embedding techniques.
- The retrieval model is evaluated by two benchmark datasets collected from Semantic Scholar and DBLP.
- TransE does not have a huge impact on improving the performance of paper similarity classification.
- TransE is able to do co-author inference based on the observed triples in a bibliographic dataset.

FUTURE WORK

- More advanced sequence models like LSTM can be used instead of PV-DBOW to capture richer information from text content
- Build a joint learning model which will help both of the embedding learning processes
- Instead of using a generic knowledge graph embedding model such as TransE, explore ways to build a structure embedding model which specifically focuses on bibliographic knowledge graphs
